Strategy

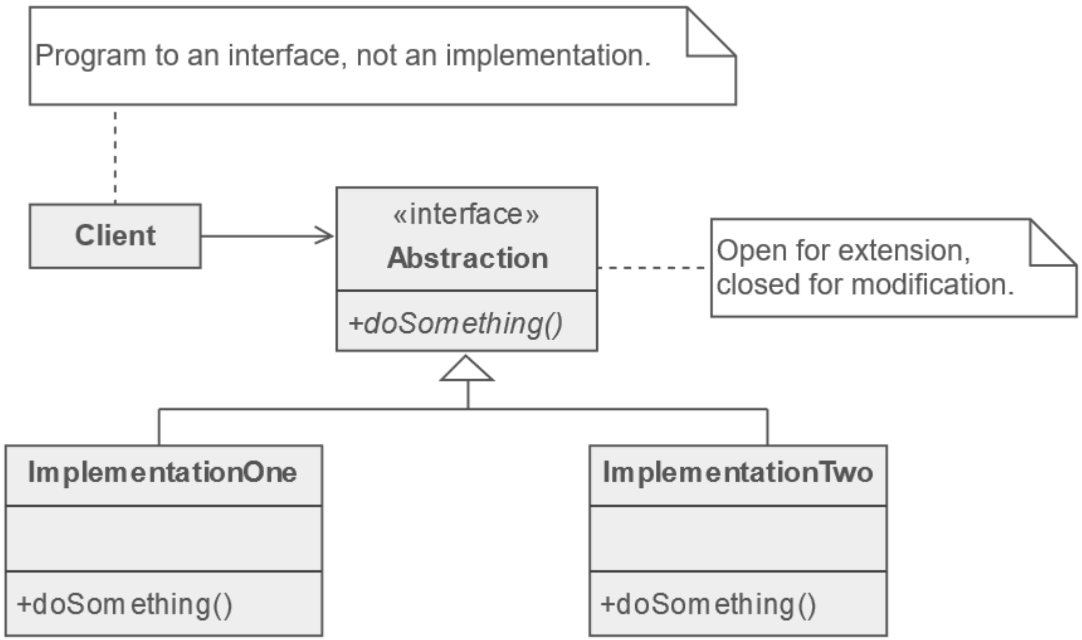
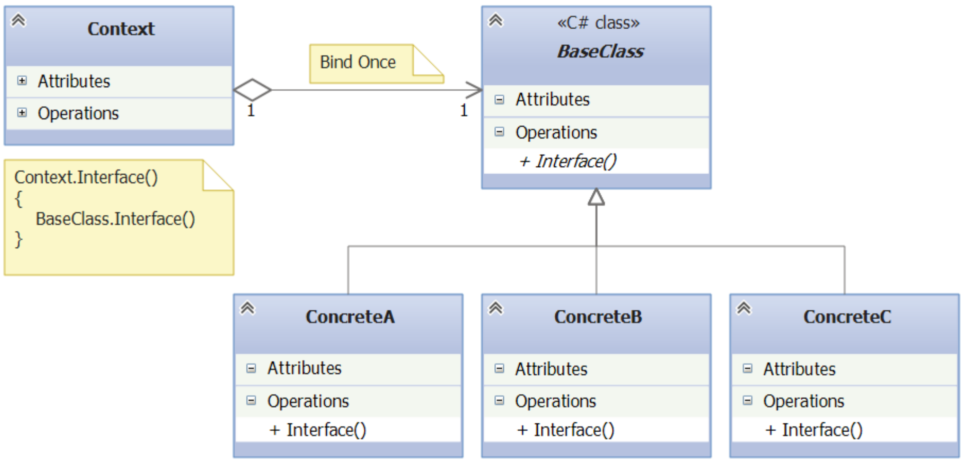
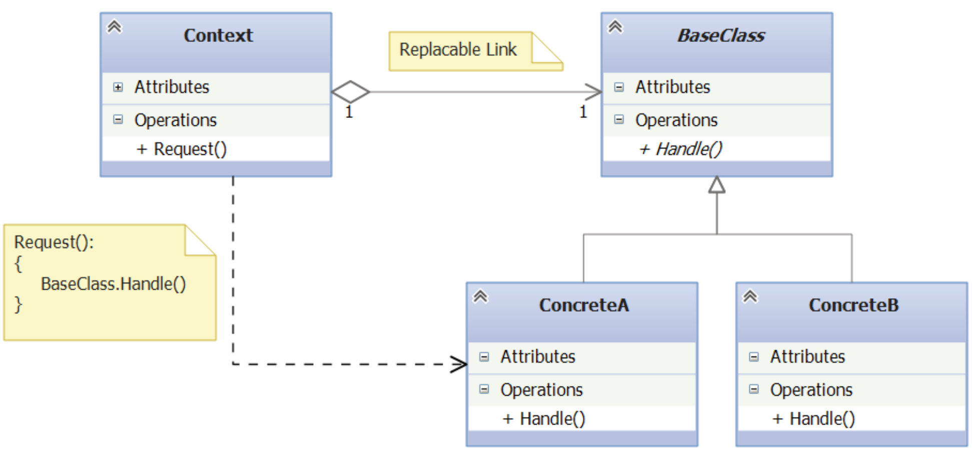
- Intent:
  - Define a family of algorithms, encapsulate each one, and make them interchangeable.
  - Strategy lets the algorithm vary independently from the clients that use it.
- Remarks
  - Capture the abstraction in an interface, bury implementation details in derived classes.



Strategy vs State





- *Differ in their intent*
- Strategy Pattern as a flexible alternative to subclassing
  - if you use inheritance to define the behavior of a class,
    - stuck with that behavior
  - Strategy you can change the behavior by composing with a different object
- State Pattern as an alternative to putting lots of conditionals in your context
  - encapsulating the behaviors within state objects
    - change the state object in context to change its behavior

Thank You!
